

Electronica S.r.l.

Quality control

Before and after functional test, specially trained operators conduct a careful visual inspection of the processes carried out in order to eliminate any non-conformities. So that this operation may be performed correctly, **Prestel Electronica S.r.l.** have provided our operators with holed tables on which to lay out the sections of wiring to be inspected, the technical documentation and the clients' working standards, and a PC for producing certificates of conformity.

The inspection process consists principally of examination of the following areas:

Document checks

Size checks

Special crimping process checks

Special soldering process checks

Hosing and sleeving checks

Boot checks

Sealant checks

Fastenings checks

Ring nut and backshell locking checks

Identification checks

Pin insertion checks

Specific checks
